This handbook applies to students starting the Master of Mathematics and Physics (MMathPhys) or the MSc in Mathematical and Theoretical Physics in Michaelmas term 2015. The information in this handbook may be different for students starting in other years.

The Examination Regulations relating to this course are available at

http://www.admin.ox.ac.uk/examregs/2015-16/hsomandtheophys/studentview/ (MMathPhys,)
http://www.admin.ox.ac.uk/examregs/2014-15/mosbcimandtheophys/studentview/ (MSc).

If there is a conflict between the information in this handbook and the Examination Regulations then you should follow the Examinations Regulations. If you have any concerns please contact mathematical.physics@maths.ox.ac.uk.

The information in this handbook is accurate as at 5 October 2015, however it may be necessary for changes to be made in certain circumstances, as explained at www.ox.ac.uk/coursechanges. If such changes are made the department will publish a new version of this handbook together with a list of the changes and students will be informed.
Welcome

Welcome to the Oxford Master Course in Mathematical and Theoretical Physics. Our course provides a high-level education in the areas of Theoretical Particle Physics/String Theory, Condensed Matter Theory, Theoretical Astrophysics/Fluids and Mathematical Foundations of Theoretical Physics up to the level of research.

As you are probably aware, there is considerable flexibility in designing your path through the course; you can decide to focus on one of the above areas or study more widely across areas. It is important that you consider your choices carefully. Consult the syllabi and the case studies in this handbook for more information and, if in doubt, talk to your personal tutor or an academic related to the programme.

For an advanced programme of this kind written examinations are not always the best form of assessment. You will find that the way we evaluate your work often correlates with the nature of the material. Typically, there will be formal written exams for the basic, foundational courses, other forms of assessment such as take-home exams or mini-projects for intermediate courses and a home-work completion requirement for advanced courses. There are certain constraints on assessment - for example you have to sit four written exams. Be sure that your course choices are consistent with these constraints. Also note that Trinity term is devoted to advanced courses and there is no designated revision period.

Passing exams is a necessary and important part of learning and education but we hope you agree that there is significantly more to it. Enthusiasm, engagement with the subject, the desire for deep and profound understanding is what truly motivates us and we hope this is how you will engage with the course. We wish you a successful, productive and insightful year.

Xenia de la Ossa and Andre Lukas

1 Introduction

This handbook contains important information about the Masters course in Mathematical and Theoretical Physics. It is intended as a guide and reference for you throughout the course. There are a number of other sources of information that you will need to refer to during your course and links to these are given below, together with a list of key contact.

1.1 Key Sources of Information

Course website: [http://mmathphys.physics.ox.ac.uk/](http://mmathphys.physics.ox.ac.uk/) The course schedule, details of seminars and the online course handbook can all be found here.

Mathematical Institute website: [http://www.maths.ox.ac.uk/](http://www.maths.ox.ac.uk/)

Department of Physics website: [www.physics.ox.ac.uk](http://www.physics.ox.ac.uk)

Examination Regulations: [http://www.admin.ox.ac.uk/examregs/](http://www.admin.ox.ac.uk/examregs/) The University’s examination regulations govern all academic matters within the University and contain the general regulations for the conduct of University examinations, as well as specific regulations for each degree programme offered by the University.

Examination Conventions: The examination conventions for the course set out how each unit will be assessed and how the final degree classification will be derived from the marks obtained for the individual units. The examination conventions can be found online at [http://mmathphys.physics.ox.ac.uk/students](http://mmathphys.physics.ox.ac.uk/students).

Oxford Student website: [http://www.ox.ac.uk/students](http://www.ox.ac.uk/students). This website provides access to information, services and resources.

Oxford Student Handbook: [http://www.admin.ox.ac.uk/proctors/info/pam/](http://www.admin.ox.ac.uk/proctors/info/pam/) This contains general information and guidance about studying at the University of Oxford, and gives you formal notification and explanation of the University’s codes, regulations, policies and procedures.

College Handbook: The handbook for your college will be available on the college website.

email: mathematical.physics@maths.ox.ac.uk

Mathematical Institute Reception (tel: (2)73525)
1.3 The Academic Year

The course lasts three terms, from the beginning of October to the end of the following June. Some work is carried out in the vacations.

For the academic year 2015-2016, the course begins with an induction on 6 October 2015. The dates of the University Full Terms for the Academic Year 2015–2016 are:

MT = Michaelmas Term 2014: 11 October – 5 December
HT = Hilary Term 2015: 17 January – 12 March
TT = Trinity Term 2015: 24 April – 18 June

A calendar of important dates is given in Appendix A.

1.4 Finding Your Way Around

Teaching for the course will take place in the Mathematical Institute ([http://www.maths.ox.ac.uk/about-us/travel-maps](http://www.maths.ox.ac.uk/about-us/travel-maps)) and in the Denys Wilkinson Building or in the Clarendon Building of the Department of Physics ([http://www.physics.ox.ac.uk/contact/Physicsmap.pdf](http://www.physics.ox.ac.uk/contact/Physicsmap.pdf)). To enter the Denys Wilkinson Building, go up the wide concrete steps from Keble Road; turn left at the top and the entrance is facing you. The main entrance to the Clarendon in on Parks Road, next to the University Parks.

A searchable, interactive map of all college, department and libraries can be found at [http://www.ox.ac.uk/visitors/maps-and-directions/searchable-map](http://www.ox.ac.uk/visitors/maps-and-directions/searchable-map).
2 The MSc Course

2.1 Overview

The Master’s Course in Mathematical and Theoretical Physics is offered in two modes, the MMathPhys for Oxford students and the MSc for students from outside Oxford. The academic content is identical for both modes. If you are an Oxford MPhys, MMath or MPhysPhil student, who transfers to the MMathPhys you will graduate as a “Master of Mathematical and Theoretical Physics” with a double classification consisting of the BA degree class in your original subject and an MMathPhys degree class. If you are a student on the MSc course, you will graduate with an “MSc in Mathematical and Theoretical Physics.”

These qualifications may be compared to national standards for higher education qualifications through the Framework for Higher Education Qualifications (FHEQ). The University awards framework (UAF) maps the awards of the University against the levels of the FHEQ. The FHEQ level for both the MMathPhys course and MSc course is 7. The relevant subject benchmark statements for the course, which set out expectations about standards of degrees in a given subject area, are Physics & Astronomy (QAA 2008) and Mathematics, Statistics & Operational Research (QAA 2015).

2.2 Aims

The Oxford Master’s Course in Mathematical and Theoretical Physics aims to provide students with a high-level, internationally competitive training in mathematical and theoretical physics, right up to the level of modern research in the area.

As a graduate of this programme you will be in a prime position to compete for research degree places in an area of Theoretical and Mathematical Physics at leading research universities in the UK or overseas; or to pursue a research-related career, based on the acquired high-level ability in mathematics and its applications to physical systems, outside academia.

2.3 Learning Outcomes

During the course you will develop a knowledge and understanding of:

- Theoretical and Mathematical Physics, focusing on one of the areas of Theoretical Particle Physics, Theoretical Condensed Matter Physics, Theoretical Astrophysics/Fluids, or studying across these areas.

- A broad range of physical phenomena and their description within Theoretical Physics.

- A wide range of advanced mathematical techniques and how they are applied in Theoretical Physics.

You will also have the opportunity to develop the following skills.

Intellectual Skills

- An appreciation of the principles of Theoretical and Mathematical Physics and their application to natural phenomena.

- The ability to model physical phenomena and deploy a wide range of mathematical physics methods for their description.
A working knowledge of high-level mathematical methods and their application to systems in physics and beyond.

Practical Skills

- Ability to apply mathematical methods to practical problems.
- Ability to construct, write-up and communicate logical arguments of some complexity.

Transferable Skills

- Ability to solve problems effectively and to apply high-level mathematical methods to a wide range of problems.
- Ability to manage your time and to acquire a complex body of knowledge in a limited time.
- Ability to manage your own learning and study for research or other professional qualifications.

2.4 Course Structure

The programme consists of a large array of lecture courses covering the main areas of modern Theoretical/Mathematical Physics and Applied Mathematics. The courses are subdivided into the following strands:

- Quantum Field Theory, Particle Physics and String Theory
- Theoretical Condensed Matter Physics,
- Mathematical Foundations of Theoretical Physics

As various areas of Theoretical and Mathematical Physics are in fact, interconnected, routed in universal principles and thrive on ideas that cross any sub-field boundaries, a number of courses are shared between the three strands and emphasise the unity of the subject. This applies especially to the foundational courses offered in Michaelmas term. These are followed by increasingly specialised courses in Hilary and Trinity terms, although those too will strive to make connections between subject areas.

There are no compulsory courses and you will thus be able to choose a path reflecting your intellectual tastes or career choices; Appendix C gives examples of different pathways through the course. An overview of the courses can be found in the table accompanying this section. Detailed synopsis for each course can be found in Appendix B and a table providing details of the assessment method for each course can be found in Appendix A of the examination conventions.

In addition to the courses listed in the table, which are offered explicitly as part of the MMathPhys/MSc programme, you will also be allowed to choose a maximum of three-units worth of MMath Part C (see [http://www.maths.ox.ac.uk/members/students/undergraduate-courses/teaching-and-learning/](http://www.maths.ox.ac.uk/members/students/undergraduate-courses/teaching-and-learning/)) or MPhys Part C (see [http://www.physics.ox.ac.uk/lectures/](http://www.physics.ox.ac.uk/lectures/)) lecture courses that are not listed here, subject to approval by the Director of Studies. Approval should be sought by Friday of week 4 of Michaelmas term.

You will be required to require to undertake 10 units, with 1 unit corresponding to 16 hours of lectures. This means that 16-hour lecture courses count as one unit, while, for example, 24-hour lecture courses count as 1.5 units. More specifically you are required to offer:

(a) **four units that are assessed by written invigilated exams,**
(b) three units that are assessed by written invigilated exams or in other ways,

(c) three other units (which may be from courses with homework completion requirement only or from assessed courses),

(d) an oral presentation.

One of the 10 units (a), (b), (c) can be replaced by a dissertation. There are no other formal constraints on course choices and students are otherwise free to design their own pathways (although paying close attention to the guidance offered is strongly recommended). Please note that it is your responsibility to ensure that you fulfil the requirements for the overall number of units and the number of assessed units. The modes of assessment and details on completion requirements for all courses are provided in Appendix A of the exam conventions.

You will be offered detailed academic guidance from the Director of Studies or an Academic Adviser designated by the Director of Studies on choosing an individual path suitable for you. Course lecturers will also advise on the recommended background for their courses or possible follow-up courses you might wish to choose.

Legend for fonts, colours and superscripts in the Table:

**Bold:** a foundational course;

Plain: an interdisciplinary course shared between strands;

*Italic:* a course special to a particular strand;

Red\(^{(PU:NN)}\): a course also taught (in some cases in part) as a Part C course in Physics, NN is its number;

Blue\(^{(MU:NNN)}\): a course also taught as a Part B or C course in Mathematics, NNN is its number;

Purple\(^{(MG)}\): a course also taught as a PG course in Mathematics;

Black: an MMathPhys/MSc course, also taught as a PG course in Physics;

\(^{*}\): a course that may not be available every year.

</table>
3 Teaching and Learning

3.1 Organisation of Teaching

Teaching for the course will be provided jointly by the Department of Physics and the Mathematical Institute through lectures and classes. In addition, students undertaking a dissertation will have supervision meetings with their dissertation supervisor.

3.2 Lectures

Depending on the options you take you will have between 6-8 hours of lectures per week. The lecture timetable for each term will be made available on the course website [http://mmathphys.physics.ox.ac.uk/](http://mmathphys.physics.ox.ac.uk/).

Course Material

Course material, such as lecture notes and problem sheets, will be published on the Mathematical Institute’s website and the Department of Physics’ website. Students should follow the links to the appropriate pages from the lecture schedule on the course website.

3.3 Classes

Lecture courses will normally be accompanied by problem sets and weekly or fortnightly problem classes. Classes will usually contain 8–10 students. For most courses you will need to sign-up for the set of classes you wish to attend at the start of each term, and this is usually done via an online sign-up system. You will be sent an email in week 0 alerting you that class registration is open and providing you with details of the registration process. You can find out which class you have been allocated to by looking at the class lists ([https://minerva.maths.ox.ac.uk/perl/classlists.pl](https://minerva.maths.ox.ac.uk/perl/classlists.pl)). For classes accompanying courses taught by the Physics Department, particularly those part of the undergraduate MPhys course, you will be provided information on the classes and sign-up process by the course co-ordinator.

Before each class you will need to submit your problem sheet to the class teaching assistant for marking. For courses for which there is a homework completion requirement you will need to submit your problem sheet online (following the process described below). For all other courses you should submit your problems sheets as instructed by the class tutor. The table in Appendix A of the examination conventions indicates for which courses there is a homework completion requirement.

You should always submit your problem sheet before the stated deadline. However, this is particularly important for courses which have a homework completion requirement as late problem sheets will only be accepted in exceptional circumstances. Please see section 3.4 of the examination conventions for further information.

Online Submission Process

- If you have hand-written your problem sheet, you can use the photocopiers in the Mathematical Institute or University libraries to scan your work.
• Go to [https://www0.maths.ox.ac.uk/node/add/course-work](https://www0.maths.ox.ac.uk/node/add/course-work) and log in using your Mathematical Institute IT account when prompted.

• Enter your candidate number in the box and select the course you are submitting a problem sheet for from the drop-down menu.

• Upload your problem sheet.

• Press save to submit your work.

• You will receive an email confirming that your work has been submitted successfully.

3.4 Dissertations

You may opt to offer a dissertation as one of your ten units. A dissertation offers a substantial opportunity for independent study and research, and would be undertaken under the guidance of a member of the Department of Physics or the Mathematical Institute. A dissertation involves investigating and then presenting in writing a particular area of Mathematical Physics or Theoretical Physics; you would not be required (but may) obtain original results. A list of possible dissertation topics is given in Appendix D but you are not limited to this list and may propose your own topic instead.

If you intend to undertake a dissertation you will need to notify the Joint Supervisory Committee for the course by Monday of week 2 of Hilary term. As such you are advised to start thinking about your dissertation and make initial contact with potential supervisors during Michaelmas term. You should submit to the Joint Supervisory Committee a typed abstract of at least 100 words (but no more than one A4 sheet) together with a list of the main references you will be using. The Committee will consider all abstracts at its meeting in week 3 of Hilary term and communicate its decision to students as soon as possible thereafter (abstracts submitted before the end of Michaelmas term will be considered earlier). The submission deadline for dissertations is noon on Monday, week 5 of Trinity Term.

You should plan on beginning work on your dissertation soon after your abstract has been approved. You are advised to bear in mind that you will need to use your time in the Easter vacation and early Trinity term wisely to balance preparing for the Trinity term exams, working on your dissertation, and completing work for other courses you may be taking.

Your supervisor will read and provide feedback on the initial draft of your dissertation (provided that it is submitted to them in good time!).

The submitted dissertation should conform to the following points.

• The dissertation must include an abstract and a bibliography.

• The dissertation must be word-processed and have a font size of 12pt.

• The text should be double spaced and the dissertation printed single-sided.

• The dissertation should be spiral-bound or soft-bound.

• The dissertation should have a title page which includes the following:
  – the title of dissertation,
  – the candidate’s examination number,
  – the title of the candidate’s degree course,
  – the term and year of submission.
3.5 Advice on Teaching and Learning Matters

There are a number of people you can consult for advice on teaching and learning matters. Supervisors will be appointed for all students at the start of the course and will be available for consultation on any academic matter. Students can also seek guidance on academic matters from their college personal tutor. All students will receive academic guidance from the Director of Studies.

If you have any issues with teaching or supervision please raise these as soon as possible so that they can be addressed promptly. Details of who to contact are provided in Section 7.2 Complaints and Appeals.

3.6 Skills and Learning Development

Expectations of Study

You are responsible for your own academic progress. Therefore, in addition to the formal teaching you receive through lectures, classes and dissertation tutorials, you will be expected to undertake a significant amount of self-directed, independent study both during term time and in the vacations. You are advised to read the University’s guidance on undertaking paid work at [http://www.ox.ac.uk/students/life/experience](http://www.ox.ac.uk/students/life/experience).

Your academic process will be monitored by your supervisor and also your college tutor. College tutors and supervisors will receive reports from the class tutors for the classes you attend. In addition, supervisors of MSc students will submit termly reports on their student’s progress via the Graduate Supervision System. These reports are reviewed by the Director of Studies. If you are concerned about your academic progress please contact your college tutor, supervisor or the Director of Studies.

University Lectures and Departmental Seminars

University lectures in all subjects are open to all students. A consolidated lecture list is available on the University website at: [http://www.ox.ac.uk/students/academic/lectures/](http://www.ox.ac.uk/students/academic/lectures/).

Seminars and colloquia given in the Mathematical Institute and Physics Department, often by mathematicians and physicists of international repute, are announced on the departmental notice boards ([https://www.maths.ox.ac.uk/events/list](https://www.maths.ox.ac.uk/events/list) and [http://www2.physics.ox.ac.uk/research/rudolf-peierls-centre-for-theoretical-physics/seminars](http://www2.physics.ox.ac.uk/research/rudolf-peierls-centre-for-theoretical-physics/seminars)); you are encouraged to attend any which interest you.

Study Skills

Much of the advice and training in study skills will come in the regular class teaching you receive. A wide range of information and training materials are available to help you develop your academic skills – including time management, research and library skills, referencing, revision skill and academic writing – through the Oxford Student website: [http://www.ox.ac.uk/students/academic/guidance/skills](http://www.ox.ac.uk/students/academic/guidance/skills).
3.7 Key Teaching Links

Lecture Timetable: [http://mmathphys.physics.ox.ac.uk/course-schedule](http://mmathphys.physics.ox.ac.uk/course-schedule)

Registration for Classes: [https://www0.maths.ox.ac.uk/courses/class-registration](https://www0.maths.ox.ac.uk/courses/class-registration)

Class Lists: [https://minerva.maths.ox.ac.uk/perl/classlists.pl](https://minerva.maths.ox.ac.uk/perl/classlists.pl)

Physics Class Information: Follow links to course pages from [https://mmathphys.physics.ox.ac. uk/course-schedule](https://mmathphys.physics.ox.ac.uk/course-schedule)

Problem Sheet Submission: [https://www0.maths.ox.ac.uk/node/add/course-work](https://www0.maths.ox.ac.uk/node/add/course-work)

Project Application Form: [http://mmathphys.physics.ox.ac.uk/students](http://mmathphys.physics.ox.ac.uk/students)

Project Guidance Notes: [http://mmathphys.physics.ox.ac.uk/students](http://mmathphys.physics.ox.ac.uk/students)
4 Examinations and Assessments

4.1 Assessment of the Course

All of the units you undertake will have either a component of formal assessment (written invigilated exam, take-home exam, mini-project or dissertation) or a homework completion requirement. Each unit will be assessed by the method most suited to the material being taught. The table in the examination conventions indicates which courses are assessed and by which method and it indicates which courses have a homework completion required. The examinations are governed by the University’s Examination Regulations and the course examination conventions.

4.2 Examination Conventions

The examination conventions for the course are the formal record of the specific assessment standards for the course. They set out how each unit will be assessed and how the final degree classification will be derived from the marks obtained for the individual units. They include information on marking scales, marking and classification criteria, scaling of marks, formative feedback, resits and penalties for late submission. The examination conventions for 2015–16 can be found on the course website at [http://mmathphys.physics.ox.ac.uk/](http://mmathphys.physics.ox.ac.uk/).

4.3 Examination Entries

You will need to formally enter for the units you wish to be assessed on, including those courses which only have a homework completion requirement, by completing an examination entry form. This is done online through Student Self Service ([https://evision.ox.ac.uk/](https://evision.ox.ac.uk/)) and further information on the process can be found at [http://www.ox.ac.uk/students/academic/exams/entry](http://www.ox.ac.uk/students/academic/exams/entry). For this course there will be three examination entry dates:

- **Friday 6th November, week 4**, Michaelmas term for Michaelmas term courses with Michaelmas term submissions and courses examined by invigilated written examination in Hilary term;
- **Friday 29th January, week 2**, Hilary term for Hilary term courses with Hilary term submissions, all courses assessed by invigilated written examination in Trinity term and the dissertation option;
- **Friday 29th April, week 1**, Trinity term for Trinity term courses.

4.4 Examination Dates and Submission Deadlines

The calendar of important dates (Appendix A) gives the expected start dates for the invigilated written examinations and coursework submission deadlines. The examination timetable for invigilated written examinations will be set by the Examination Schools and published online at: [http://www.ox.ac.uk/students/academic/exams/timetables](http://www.ox.ac.uk/students/academic/exams/timetables).

4.5 Preparation and Submission of Coursework

4.5.1 Mini-Projects and Take-Home Examinations

Some units will be assessed wholly or partially by submitted work. This will take one of two forms: mini-project or take-home examination. The deadline for the submission of the assessment for each unit is given
in the table included in the examination conventions.

The examiners will send out notices to candidates detailing where your work should be submitted, how many copies you should submit, and what format your submission should be in (e.g. handwritten or word-processed). For certain courses candidates will be required to submit an electronic copy. Details of the courses to which this applies, and instructions on the online submission process will be included in the notice to candidates.

It is vital that you submit your work by the given deadline as any late submission will be reported to the Proctors and a late submission penalty may be applied (see section 5 in the examination conventions). Please see the examination conventions and the Oxford Student website (http://www.ox.ac.uk/students/academic/exams/submission) for advice on what to do if you are unable to submit your work on time due to medical emergency or other urgent cause.

4.5.2 Dissertation

The deadline for submission of the dissertation is 12noon on Monday of week 5, Trinity Term. Students will be required to submit three bound copies of their dissertation, together with a declaration of authorship form, to the Chair of Examiners, Mathematical and Theoretical Physics, c/o Examination Schools, High Street, Oxford, OX1 4BG. Please note the information in section 4.5.1 regarding the importance of submitting your work on time.

4.5.3 Plagiarism

Plagiarism is presenting someone else’s work or ideas as your own, with or without their consent, by incorporating it into your work without full acknowledgement. All published and unpublished material, whether in manuscript, printed or electronic form, is covered under this definition. Plagiarism may be intentional or reckless, or unintentional. Under the regulations for examinations, intentional or reckless plagiarism is a disciplinary offence. Please see the University’s guidance on plagiarism http://www.ox.ac.uk/students/academic/guidance/skills/plagiarism for further information.

4.6 Sitting Invigilated Written Examinations

Information on (a) the standards of conduct expected in examinations and (b) what to do if you would like examiners to be aware of any factors that may have affected your performance before or during an examination (such as illness, accident or bereavement) are available on the Oxford Student website (http://www.ox.ac.uk/students/academic/exams) and in Section 8.2 of the examination conventions.

4.7 Oral Presentation

All students are required to give an oral presentation on a specialist topic in Trinity Term. See Section 3.5 of the examination conventions for further details. The oral presentations will be organised by a coordinator appointed by the Joint Supervisory Committee for the MMathPhys/MScMTP.

A list of possible topics is given in Appendix E. Students undertaking a dissertation must give their oral presentation on the subject of their dissertation. Students may also approach the coordinator to propose their own topics. Students are asked to send the title of their intended topic, together with a short abstract to the coordinator by Monday of week 2 of Hilary term (for students offering a dissertation this forms part of the dissertation application process and they do not need to make a separate submission).
The presentation should not be longer than 30 minutes and there will be a 10 minute discussion session after the presentation. You are free to choose whether you want to give a blackboard presentation or use slides. Further details will be circulated to all students by email in Hilary term.

4.8 Examination Prizes

A prize may be awarded by the Examiners for excellence in examination for the Master of Mathematics and Physics (MMathPhys) or MSc in Mathematical and Theoretical Physics. The assessors of a dissertation that, in their view, shows particular originality and/or insight may recommend to the Examiners that this dissertation be given a commendation. A prize may be awarded by the examiners for the best dissertation.

4.9 Key Assessment Links

Examination Regulations: [http://www.admin.ox.ac.uk/examregs/](http://www.admin.ox.ac.uk/examregs/)

Past examiners reports - Part C Physics: [https://weblearn.ox.ac.uk/portal/hierarchy/mpls/physics/teaching/undergrads/examreports](https://weblearn.ox.ac.uk/portal/hierarchy/mpls/physics/teaching/undergrads/examreports)
5 Resources and Facilities

5.1 Departmental Work and Social Spaces

You will be able to use the computers and desks in the Mezzanine Study Room to work within the Mathematical Institute. The study room has power sockets for students wishing to use their own laptops and there is wi-fi throughout the building.

The Institute’s café is also located on the mezzanine level and has seating and tables for 100. The café serves drinks, snacks and meals from 8.30–16.15. Students are also welcome to use the Common Room on the first floor.

5.2 Libraries

Whitehead Library, Mathematical Institute

Website: http://www.maths.ox.ac.uk/members/library
Contact: Ms Cathy Hunt (Librarian) — library@maths.ox.ac.uk
This library holds material covering mathematical topics at graduate and research level, including mathematical physics.

Theoretical Physics Collection, Department of Physics

Radcliffe Science Library (RSL)

Website: http://www.bodleian.ox.ac.uk/science/
The Radcliffe Science Library is the main Science Library of the University.

Further information about all Oxford Libraries can be found at: http://www.bodleian.ox.ac.uk/libraries/libraries

5.3 Computing Facilities

Information regarding the University’s IT Services can be found at http://www.it.ox.ac.uk/

IT and Email accounts

At the departmental induction session you will be given a Mathematical Institute IT account and email address. The email address will be of the format

firstname.lastname@maths.ox.ac.uk.

It is important that you either read this email regularly or set up a forward from it to an account which you do read regularly.

MSc students will also receive a University ‘single-sign-on’ IT account. This will have an email address associated with it which will be of the format

firstnamelastname@maths.ox.ac.uk.
It is important that students either read this email regularly or set up a forward from it to an account which they do read regularly. MMathPhys students will retain the account they were issued with at the start of their degree.

For further information about Departmental IT matters, including rules and regulations surrounding the use of IT facilities, please see [http://www.maths.ox.ac.uk/members/it](http://www.maths.ox.ac.uk/members/it)

You will have access to various licences for further details go to [http://www.maths.ox.ac.uk/members/it/software-personal-machines](http://www.maths.ox.ac.uk/members/it/software-personal-machines).

### 5.4 Careers Service

Careers guidance is provided by the Careers Service ([http://www.careers.ox.ac.uk/](http://www.careers.ox.ac.uk/)), which also provides training in writing applications, interview techniques and analysis of transferable skills. The Careers Service provides information about occupations and employers, and advertises work experience opportunities.

In addition to its general programme, the Careers Service runs an annual ‘Jobs for Mathematicians’ half-day, in collaboration with the Mathematical Institute. At this event there are talks from alumni working in various industries and a talk for those interested in continuing on to further postgraduate study. Further information about postgraduate study opportunities at the Mathematical Institute can be found at [http://www.maths.ox.ac.uk/study-here/postgraduate-study](http://www.maths.ox.ac.uk/study-here/postgraduate-study) and at [http://www2.physics.ox.ac.uk/study-here/postgraduates](http://www2.physics.ox.ac.uk/study-here/postgraduates) for opportunities in the Department of Physics.
6 Student Representation and Feedback

6.1 Student Representation

Students will be able to nominate a representative to sit on the Joint Supervisory Committee (JSC) which oversees the course. Volunteers will be sought at the Induction Session and an election held if necessary. The student representative will be able to raise matters with the JSC on behalf of the cohort.

6.2 Consultative Committee for Graduates – Mathematics

The Consultative Committee for Graduates meets regularly once a term and discusses any matters that graduate students wish to raise. Students will be invited to nominate a representative to serve as the Mathematics and Physics rep on this committee via email in Michaelmas term.

6.3 The Physics Joint Consultative Committee

The Physics Joint Consultative Committee (PJCC) has elected undergraduate members who meet twice in MT and HT, and once in TT to discuss both academic and administrative matters with academic staff representatives. See http://www.physics.ox.ac.uk/pjcc/ for more information.

6.4 Divisional and University Representatives

The MPLS Division also runs a divisional Undergraduate Joint Consultative Forum, a divisional Graduate Joint Consultative Forum, and is establishing a Joint Consultative Forum for Graduate Taught Courses. Each Forum is chaired by the senior MPLS Academic who is responsible for that area across the Division, an undergraduate or graduate representative from each department, the undergraduate or graduate representative on the Academic Committee and Divisional Board, and the Oxford Union Student Union (OUSU) Vice-President (Access and Academic Affairs) or Vice-President (Graduates).

Student representative sitting on the MPLS Divisional Board are selected through a process organised by OUSU. Details can be found on the OUSU website along with information about student representation at the University level.

6.5 Opportunities to Provide Feedback

Students will be asked to complete questionnaires evaluating the teaching received for each unit. Please take time to complete these as your feedback is valuable for future course planning.

MSc students, like all students on matriculated courses, will be surveyed on all aspects of their course (learning, living, pastoral support, college) through the annual Student Barometer. Previous results can be viewed by students, staff and the general public at: www.ox.ac.uk/students/life/feedback MMathPhys students, as final year undergraduates, will be surveyed through the National Student Survey instead. Results from previous NSS can be found at www.unistats.com.

6.6 Key Student Representation Links

CCG: http://www.maths.ox.ac.uk/members/students/postgraduate-courses/doctor-philosophy/
consultative-committee-graduates Minutes of meetings and list of student representatives.

OUSU: http://ousu.org/

University Surveys: http://www.ox.ac.uk/students/life/feedback
7 Student Support and Academic Policies

7.1 Where to Find Help

Generally speaking for graduate students departments are the main source of academic support and colleges are the main source of pastoral support. For undergraduate students colleges also play a key role in providing academic support.

Every college has their own systems of support for students, please refer to your college handbook or website for more information in who to contact and what support is available through your college.

Details of the wide range of sources of support available more widely in the University are available from the Oxford Student website (http://www.ox.ac.uk/students/welfare), including in relation to mental and physical health and disability.

7.2 Complaints and Academic Appeals

The University, the MPLS Division and the Mathematical Institute and the Department of Physics all hope that provision made for students at all stages of their course of study will make the need for complaints (about that provision) or appeals (against the outcomes of any form of assessment) infrequent.

Nothing in the University’s complaints procedure precludes an informal discussion with the person immediately responsible for the issue that you wish to complain about (and who may not be one of the individuals identified below). This is often the simplest way to achieve a satisfactory resolution.

Many sources of advice are available within colleges, within faculties/departments and from bodies like Student Advice Service provided by OUSU or the Counselling Service, which have extensive experience in advising students. You may wish to take advice from one of these sources before pursuing your complaint.

General areas of concern about provision affecting students as a whole should be raised through Joint Consultative Committees or via student representation on the department’s committees.

Complaints

If your concern or complaint relates to teaching or other provision made by the faculty/department, then you should raise it with the chairman of the Joint Supervisory Committee (Prof. Andre Lukas) or with the Director of Graduate Studies (Prof. Andreas Muench) as appropriate. Within the faculty/department the officer concerned will attempt to resolve your concern/complaint informally.

If you are dissatisfied with the outcome, then you may take your concern further by making a formal complaint to the University Proctors. The procedures adopted by the Proctors for the consideration of complaints and appeals are described on the Proctors’ webpage (www.admin.ox.ac.uk/proctors/complaints/proceduresforhandlingcomplaints), the Student Handbook (www.admin.ox.ac.uk/proctors/info/pam) and the relevant Council regulations (www.admin.ox.ac.uk/statutes/regulations/247-062.shtml).

If your concern or complaint relates to teaching or other provision made by your college, you should raise it either with your tutor or with one of the college officers, Senior Tutor, Tutor for Graduates (as appropriate). Your college will also be able to explain how to take your complaint further if you are dissatisfied with the outcome of its consideration.
Academic Appeals

An academic appeal is defined as a formal questioning of a decision on an academic matter made by the responsible academic body.

For undergraduate or taught graduate courses, a concern which might lead to an appeal should be raised with your college authorities and the individual responsible for overseeing your work. It must not be raised directly with examiners or assessors. If it is not possible to clear up your concern in this way, you may put your concern in writing and submit it to the Proctors via the Senior Tutor of your college.

For the examination of research degrees, or in relation to transfer or confirmation of status, your concern should be raised initially with the Director of Graduate Studies. Where a concern is not satisfactorily settled by that means, then you, your supervisor, or your college may put your appeal directly to the Proctors.

As noted above, the procedures adopted by the Proctors in relation to complaints and appeals are described on the Proctors webpage (www.admin.ox.ac.uk/proctors/complaints/proceduresforhandlingcomplaints), the Student Handbook (www.admin.ox.ac.uk/proctors/info/pam) and the relevant Council regulations (www.admin.ox.ac.uk/statutes/regulations/247-062.shtml).

Please remember in connection with all the academic appeals that:

• The Proctors are not empowered to challenge the academic judgement of examiners or academic bodies.

• The Proctors can consider whether the procedures for reaching an academic decision were properly followed; i.e. whether there was a significant procedural administrative error; whether there is evidence of bias or inadequate assessment; whether the examiners failed to take into account special factors affecting a candidate’s performance.

• On no account should you contact your examiners or assessors directly.

7.3 Student Societies

There are number of Mathematics and Physics student societies which you may like to join. Details of the main societies are given below. In addition there are also over 200 clubs and societies covering a wide range of interest which you may join or attend. A full list is available at http://www.ox.ac.uk/students/life/clubs/list.

Invariants

The Oxford University’s student society for Mathematics. The society promotes Maths and hosts informal lectures, often given by leading mathematicians. Website: http://www.invariants.org.uk/.

Mirzakhani Society

The Mirzakhani Society is a society aimed at supporting women in Oxford who are studying maths. Their main event is ‘Sip and Solve’ which happens once a week, tea and cake are provided, and women are encouraged to come along to do problem sheets. Contact: mirzakhanisociety@gmail.com.
The Oxford University Physics Society

The Oxford University Physics Society (PhysSoc) is a student society that exists to promote and encourage an interest in Physics in and around Oxford University. PhysSoc hosts talks most weeks during termtime in the Physics Department, often by leading experts and also holds social events which are a great opportunity to get to know others with an interest in all things Physics. Website: [http://www.physsoc.co.uk/](http://www.physsoc.co.uk/)

7.4 University Policies

The University has a wide range of policies and regulations that apply to students. These are easily accessible through the A–Z of University regulations, codes of conduct and policies available at [http://www.ox.ac.uk/students/academic/regulations/a-z](http://www.ox.ac.uk/students/academic/regulations/a-z). Particular attention is drawn to the following University policies.

**Equal Opportunities Statement:** [http://www.admin.ox.ac.uk/eop/missionstatement/integratedequalitypolicy/](http://www.admin.ox.ac.uk/eop/missionstatement/integratedequalitypolicy/)

**Intellectual Property Rights:** [www.admin.ox.ac.uk/rso/ip](http://www.admin.ox.ac.uk/rso/ip)

**Code on Harassment:** [http://www.admin.ox.ac.uk/eop/harassmentadvice/policyandprocedure/](http://www.admin.ox.ac.uk/eop/harassmentadvice/policyandprocedure/)

**Policy on Plagiarism:** [http://www.ox.ac.uk/students/academic/guidance/skills/plagiarism](http://www.ox.ac.uk/students/academic/guidance/skills/plagiarism)

7.5 Departmental Safety Policies

You are urged to act at all times responsibly, and with a proper care for your own safety and that of others. Departmental statements of safety policy are posted in all departments, and you must comply with them. Students should note that they (and others entering onto departmental premises or who are involved in departmental activities) are responsible for exercising care in relation to themselves and others who may be affected by their actions.

In the Mathematical Institute accidents should be reported immediately to reception, telephone 73525, who keep the accident book. There is a first aid room located on the ground floor of the South wing. If you require access to this room please report to reception.

Each lecture theatre has its own proper escape route and you are urged to familiarise yourself with these. Those for the Mathematical Institute lecture and seminar rooms, are set online at [http://www.maths.ox.ac.uk/members/building-information/security-safety-and-reporting-building-issues](http://www.maths.ox.ac.uk/members/building-information/security-safety-and-reporting-building-issues). In the case of evacuation of the lecture theatre give heed to the instructions of the lecturer.

7.6 Key Student Support Links and Contacts

**Disability Co-ordinator (Mathematics):**
Charlotte Turner-Smith (academic.administrator@maths.ox.ac.uk)

**Disability Co-ordinator (Physics):** Carrie Leonard-McIntyre (c.leonard-mcintyre@physics.ox.ac.uk)

**University’s Disability Advisory Service:** [http://www.ox.ac.uk/students/welfare/disability](http://www.ox.ac.uk/students/welfare/disability)

**Counselling Service:** (tel: (2)70300) email: counselling@admin.ox.ac.uk

**Proctors’ Office:** (tel: (2)70090) email: proctors.office@proctors.ox.ac.uk
Departmental Harassment Advisors: names and contact details displayed in Mezzanine Study Room.

Oxford University Student Union, Vice President (Welfare):
(tel: (2)88452) email: welfare@ousu.ox.ac.uk

B Course Synopses for 2015–16

Michaelmas Term

Quantum Field Theory — Dr Tomasz Lukowski — 24MT

Method of Assessment: Invigilated written examination in HT.
Weight: 1.5 units.
Areas: PT, CM, Astro, foundational course.
Sequels: Advanced Quantum Field Theory for Particle Physics (HT), Conformal Field Theory (TT), Quantum Field Theory in Curved Space-Time (TT).
Synopsis: Classical field theory, Noether’s theorem, canonical quantization, path integral formulation of quantum mechanics, path integrals in field theory: generating functionals, finite temperature field theory, Feynman diagrams, Feynman rules, divergences and regularisation, renormalisation and renormalisation group, scattering and S-matrices, response functions, path integrals for fermions.

Statistical Mechanics — Prof. Andrew Fowler — 16MT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: CM, Astro.
Remark: This course can be taken by students who have not studied this subject before (e.g., as Physics A1) but would like to be able to follow the more specialised courses offered in Hilary and Trinity that require familiarity with Statistical Mechanics.
Overview: Statistical mechanics is a subject which has fundamental and powerful connections with probability, mechanics, stochastic processes, fluid mechanics, thermodynamics, quantum mechanics (though we avoid this), and even philosophy. It is also notoriously inaccessible to applied mathematicians. This course will endeavour to trace a rational path towards classical statistical mechanics, beginning with classical mechanics, and then developing the concepts of thermodynamics through study of the Boltzmann equation. In passing, we derive the Navier-Stokes equations, before developing a mechanically-based formulation of thermodynamics and its famous second law concerning entropy. The latter parts of the course develop a variety of applications of current interest.
Learning Outcomes: Students will have developed a sound knowledge and appreciation of some of the tools, concepts, and computations used in the study of statistical mechanics. They will also get some exposure to some modern research topics in the field.
Selected applications and extensions: for example, chemical potential, phase change, binary alloys, surface energy, radiative transfer, polymer solution theory, Arrhenius kinetics, nucleation theory, percolation theory,
renormalisation.

Reading

Kinetic Theory — Dr Paul Dellar, Prof. Alex Schekochihin, Prof. James Binney — 24MT

**Method of Assessment:** Invigilated written examination in HT.

**Weight:** 1.5 units.

**Areas:** PT, CM, Astro, foundational course.

**Sequel:** Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT), Collisional Plasma Physics (TT), Galactic and Planetary Dynamics (HT).

Viscous Flow — Prof. Sarah Waters — 16 MT

**Method of Assessment:** Invigilated written examination in TT plus mini-project in MT.

**Weight:** Unit.

**Areas** CM, Astro.
Remark: This course is particularly recommended to the students who have not studied basic Fluid Dynamics (e.g., as Physics B1) and would like to be able to follow the more specialised courses offered in Hilary and Trinity and requiring familiarity with this subject.

Sequel: Advanced Fluid Dynamics (HT), Waves and Compressible Flow (HT).

Overview: Viscous fluids are important in so many facets of everyday life that everyone has some intuition about the diverse flow phenomena that occur in practice. This course is distinctive in that it shows how quite advanced mathematical ideas such as asymptotics and partial differential equation theory can be used to analyse the underlying differential equations and hence give scientific understanding about flows of practical importance, such as air flow round wings, oil flow in a journal bearing and the flow of a large raindrop on a windscreen.

Learning Outcomes: Students will have developed an appreciation of diverse viscous flow phenomena and they will have a demonstrable knowledge of the mathematical theory necessary to analyse such phenomena.

Thermal boundary layer on a semi-infinite flat plate. Derivation of Prandtl’s boundary-layer equations and similarity solutions for flow past a semi-infinite flat plate. Discussion of separation and application to the theory of flight.

Slow flow past a circular cylinder and a sphere. Non-uniformity of the two dimensional approximation; Oseen’s equation. Lubrication theory: bearings, squeeze films, thin films; Hele–Shaw cell and the Saffman-Taylor instability.

Reading

Further reading

General Relativity I — Dr Matthew Bullimore — 16MT

Method of Assessment: Invigilated written examination in TT.

Weight: Unit.

Areas: PT, CM, Astro, foundational course.

Remark: Some students may have studied this subject before (for example, as Physics B5).

Sequel: General Relativity II (HT), Cosmology (HT), Quantum Field Theory in Curved Space-Time (TT).
Overview: The course is intended as an elementary introduction to general relativity, the basic physical concepts of its observational implications, and the new insights that it provides into the nature of space time, and the structure of the universe. Familiarity with special relativity and electromagnetism will be assumed. The lectures will review Newtonian gravitation, tensor calculus and continuum physics in special relativity, physics in curved space time and the Einstein field equations. This will suffice for an account of simple applications to planetary motion, the bending of light and the existence of black holes.

Learning Outcomes: This course starts by asking how the theory of gravitation can be made consistent with the special-relativistic framework. Physical considerations (the principle of equivalence, general covariance) are used to motivate and illustrate the mathematical machinery of tensor calculus. The technical development is kept as elementary as possible, emphasising the use of local inertial frames. A similar elementary motivation is given for Einstein’s equations and the Schwarzschild solution. Cosmological solutions are discussed. The learning outcomes are an understanding and appreciation of the ideas and concepts described above.

Synopsis: Review of Newtonian gravitation theory and problems of constructing a relativistic generalisation. Review of Special Relativity. The equivalence principle. Tensor formulation of special relativity (including general particle motion, tensor form of Maxwell’s equations and the energy momentum-tensor of dust). Curved space time. Local inertial coordinates. General coordinate transformations, elements of Riemannian geometry (including connections, curvature and geodesic deviation). Mathematical formulation of General Relativity, Einstein’s equations (properties of the energy-momentum tensor will be needed in the case of dust only). Planetary motion, the bending of light, introduction to black hole solutions and the Schwarzschild solution. The introduction to cosmology including cosmological principles, homogeneity and isotropy, and the FriedmanRobertsonWalker solutions.

Reading

3. N.M.J. Woodhouse, *Notes on Special Relativity*, Mathematical Institute Notes. Revised edition; published in a revised form as *Special Relativity, Lecture notes in Physics m6* (Springer-Verlag, 1992), Chs 1–7

Further Reading

Introduction to Quantum Condensed Matter Physics — Prof. Fabian Essler — 16MT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT, CM, Astro, foundational course.
Nonequilibrium Statistical Physics — Prof. Ramin Golestanian — 16MT/HT

Method of Assessment: Invigilated written examination in TT.
Weight: 1 unit.
Areas: PT, CM, Astro, foundational course.
Sequel: Soft Matter Physics (HT), Topics in Soft & Active Matter Physics (TT)

Perturbation Methods — Prof. Jim Oliver — 16MT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT, CM, Astro, foundational course.
Sequel: Applied Complex Variables (HT).

Overview: Perturbation methods underlie numerous applications of physical applied mathematics: including boundary layers in viscous flow, celestial mechanics, optics, shock waves, reaction-diffusion equations, and nonlinear oscillations. The aims of the course are to give a clear and systematic account of modern perturbation theory and to show how it can be applied to differential equations.

Reading

Scientific Computing I — Prof. Nick Trefethen — 12MT

Method of Assessment: Take-home-exam in MT; homework completion requirement.
Weight: If taken with Scientific Computing II (recommended), 1.5. If taken without Scientific Computing II, 0.75.
Areas: PT, CM, Astro.
Sequel: Scientific Computing II (HT).

Numerical Linear Algebra — Prof. Jared Tanner — 16MT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT, CM, Astro.

Overview: Linear Algebra is a central and widely applicable part of mathematics. It is estimated that many (if not most) computers in the world are computing with matrix algorithms at any moment in time whether these be embedded in visualization software in a computer game or calculating prices for some financial option. This course builds on elementary linear algebra and in it we derive, describe and analyse a number of widely used constructive methods (algorithms) for various problems involving matrices.

Numerical Methods for solving linear systems of equations, computing eigenvalues and singular values and various related problems involving matrices are the main focus of this course.

Chebyshev polynomials and Chebyshev semi-iterative methods, conjugate gradients, convergence analysis, preconditioning.

Reading

Groups and Representations — Prof. Andre Lukas — 24MT

Method of Assessment: Invigilated written examination in HT; homework completion requirement.
Weight: 1.5 Unit.
Areas: PT, CM, Astro.

Synopsis: Basics on groups, representations, Schur’s Lemma, representations of finite groups, Lie groups, Lie algebras, Lorentz and Poincare groups, SU(n), SO(n), spinor representations, roots, classification of simple Lie algebras, weights, representations and Dynkin formalism.

Algebraic Topology — Prof. Christopher Douglas — 16MT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT.

Overview: Homology theory is a subject that pervades much of modern mathematics. Its basic ideas are used in nearly every branch, pure and applied. In this course, the homology groups of topological spaces are studied. These powerful invariants have many attractive applications. For example we will prove that the dimension of a vector space is a topological invariant and the fact that ‘a hairy ball cannot be combed’.

Learning Outcomes: At the end of the course, students are expected to understand the basic algebraic
and geometric ideas that underpin homology and cohomology theory. These include the cup product and Poincaré Duality for manifolds. They should be able to choose between the different homology theories and to use calculational tools such as the Mayer-Vietoris sequence to compute the homology and cohomology of simple examples, including projective spaces, surfaces, certain simplicial spaces and cell complexes. At the end of the course, students should also have developed a sense of how the ideas of homology and cohomology may be applied to problems from other branches of mathematics.

**Synopsis:** Chain complexes of free Abelian groups and their homology. Short exact sequences. Delta complexes and their homology. Euler characteristic.

**Reading**

**Algebraic Geometry — Prof. Alexander Ritter — 16MT**

**Method of Assessment:** Invigilated written examination in TT.

**Weight:** Unit.

**Areas:** PT.

**Overview:** Algebraic geometry is the study of algebraic varieties: an algebraic variety is roughly speaking, a locus defined by polynomial equations. One of the advantages of algebraic geometry is that it is purely algebraically defined and applied to any field, including fields of finite characteristic. It is geometry based on algebra rather than calculus, but over the real or complex numbers it provides a rich source of examples and inspiration to other areas of geometry.

**Synopsis:** Affine algebraic varieties, the Zariski topology, morphisms of affine varieties. Irreducible varieties.

Veronese morphism: definition, examples. Veronese morphisms are isomorphisms onto their image; statement, and proof in simple cases. Subvarieties of Veronese varieties. Segre maps and products of varieties. Categorical products: the image of Segre map gives the categorical product.

Coordinate rings. Hilbert’s Nullstellensatz. Correspondence between affine varieties (and morphisms between them) and finitely generate reduced $k$-algebras (and morphisms between them). Graded rings and homogeneous ideals. Homogeneous coordinate rings.

Categorical quotients of affine varieties by certain group actions. The maximal spectrum.
Primary decomposition of ideals.

Quasi-projective varieties, and morphisms of them. The Zariski topology has a basis of affine open subsets. Rings of regular functions on open subsets and points of quasi-projective varieties. The ring of regular functions on an affine variety in the coordinate ring. Localisation and relationship with rings of regular functions.

Tangent space and smooth points. The singular locus is a closed subvariety. Algebraic re-formulation of the tangent space. Differentiable maps between tangent spaces.

Function fields of irreducible quasi-projective varieties. Rational maps between irreducible varieties, and composition of rational maps. Birational equivalence. Correspondence between dominant rational maps and homomorphisms of function fields. Blow-ups: of affine space at appoint, of subvarieties of affine space, and general quasi-projective varieties along general subvarieties. Statement of Hironaka’s Desingularisation Theorem. Every irreducible variety is birational to hypersurface. Re-formulation of dimension. Smooth points are a dense open subset.

Advanced Fluid Dynamics — Prof. Alexander Schekochihin, Dr Paul Dellar — 16HT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: CM, Astro.
Prequels: Kinetic Theory (MT), an undergraduate course on Fluid Dynamics.
Sequels: Collisional Plasma Physics (TT), Soft Matter (HT).

Soft Matter Physics — Prof. Julia Yeomans, Prof. Ard Louis — 16HT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: CM.
Prequel/pre-requisite: Nonequilibrium Statistical Physics (MT)
Sequel: Topics in Soft and Active Matter Physics (TT).

Nonlinear Systems — Prof. Irene Moroz — 16HT

Method of Assessment: Invigilated written examination in TT plus additional assessment
Weight: Unit.
Areas: CM, Astro.

Overview: This course aims to provide an introduction to the tools of dynamical systems theory which are essential for the realistic modelling and study of many disciplines, including mathematical ecology and biology, fluid dynamics, granular media, mechanics, and more.
The course will include the study of both nonlinear ordinary differential equations and maps. It will draw examples from appropriate model systems and various application areas. The problem sheets will require numerical computation (using programs such as Matlab).
Learning Outcomes: Students will have developed a sound knowledge and appreciation of some of the tools, concepts, and computations used in the study of nonlinear dynamical systems. They will also get some exposure to some modern research topics in the field.

Synopsis:

1. Bifurcations
   Bifurcation theory: standard codimension one (saddle-node, pitchfork, trans-critical, Hopf) normal forms; Conservative and Non-Conservative systems.

2. Nonlinear Oscillations
   Van der Pol and Duffing’s equations. Poincaré-Lindstedt method; Method of Multiple Scales; Krylov-Bogoliubov Method of Averaging; Relaxation and Forced oscillations; Synchronization of coupled oscillators.

3. Maps
   Poincaré sections and first-return maps. Stability and periodic orbits; bifurcations of one-dimensional maps. Two-dimensional maps: Hénon map, Chirikov (standard) map.

4. Chaos in Maps and Differential Equations
   Maps: Logistic map, Bernoulli shift map, symbolic dynamics, Skinny Baker’s map, Smale’s Horseshoe Map.
   Differential equations: Lorenz equations, Rossler equations.

Reading:
Students are by no means expected to read all these sources. These are suggestions intended to be helpful.

**Advanced Quantum Field Theory for Particle Physics — Prof. Graham Ross — 24HT**

**Method of Assessment:** Invigilated written examination in TT.

**Weight:** 1.5 units.

**Areas:** PT.

**Prequel/pre-requisite:** Quantum Field Theory (MT)

**Sequels:** The Standard Model (TT), Beyond the Standard Model (TT), Non-perturbative Methods in Quantum Field Theory (TT)

**Syllabus:** Quantum Electrodynamics: Introduction, photon propagator, scalar electrodynamics (Feynman rules, radiative corrections), canonical quantization, fermions (fermions propagator, path integral and Feynman rules), spinor electrodynamics, sample calculations (scattering in spinor electrodynamics), beta function in QED. Non-Abelian Quantum Field Theory: SU(N) local gauge theory, path integral, gauge fixing, BRST, spontaneous symmetry breaking, anomalies, introduction to the standard model.

**Quantum Condensed Matter Physics II — Prof. Steve Simon — 24HT**

**Method of Assessment:** Invigilated written exam in TT (weight=0.5 unit); homework completion requirement.

**Weight:** 1.5 unit.

**Areas:** CM.

**Prequel/pre-requisite:** Introduction to Quantum Condensed Matter Physics (MT).

**Sequels:** Advanced Quantum Condensed Matter Physics (TT), Topics in Quantum Condensed Matter Physics (TT).

Waves and Compressible Flow — Prof. Ian Hewitt — 16HT

Method of Assessment: Invigilated written examination in TT plus additional assessment.
Weight: Unit.
Areas: Astro.
Prequels: Viscous Flow (MT), Kinetic Theory (MT).
Sequels: Geophysical Fluid Dynamics (TT).

Overview: Propagating disturbances, or waves, occur frequently in applied mathematics. This course will be centred on some prototypical examples from fluid dynamics, the two most familiar being surface gravity waves and waves in gases. The models for compressible flow will be derived and then analysed for small amplitude motion. This will shed light on the important phenomena of dispersion, group velocity and resonance, and the differences between supersonic and subsonic flow, as well as revealing the crucial dependence of the waves on the number of space dimensions. Larger amplitude motion of liquids and gases will be described by incorporating non-linear effects, and the theory of characteristics for partial differential equations will be applied to understand the shock waves associated with supersonic flight.

Learning Outcomes: Students will have developed a sound knowledge of a range of mathematical models used to study waves (both linear and non-linear), will be able to describe examples of waves from fluid dynamics and will have analysed a model for compressible flow. They will have an awareness of shock waves and how the theory of characteristics for PDEs can be applied to study those associated with supersonic flight.

Synopsis: Equations of inviscid compressible flow including flow relative to rotating axes.
Models for linear wave propagation including Stokes waves, internal gravity waves, inertial waves in a rotating fluid, and simple solutions.
Nonlinear Waves: method of characteristics, simple wave flows applied to one-dimensional unsteady gas flow and shallow water theory.

Reading

String Theory I — Prof. Philip Candelas — 16HT

Method of Assessment: Mini-project.
Weight: Unit.
Areas: PT.
Pre-requisite: Quantum Field Theory (MT)
Sequels: String Theory II (TT), Introduction to Gauge-String Duality (TT)
Syllabus: String actions, equations of motion and constraints, open and closed strings — boundary conditions, Virasoro algebra, ghosts and BRS, physical spectrum, elementary consideration of D branes, Veneziano amplitude.

Networks — Prof. Mason Porter — 16HT

Method of Assessment: Mini-project.
Weight: Unit.
Areas: CM.
Pre-requisite: Maths C5.3 Statistical Mechanics or another undergraduate course in Statistical Mechanics.
Sequel: Complex Systems (TT).

Overview: This course aims to provide an introduction to network science, which can be used to study complex systems of interacting agents. Networks are interesting both mathematically and computationally, and they are pervasive in physics, biology, sociology, information science, and myriad other fields. The study of networks is one of the “rising stars” of scientific endeavors, and networks have become among the most important subjects for applied mathematicians to study. Most of the topics to be considered are active modern research areas.

Learning Outcomes: Students will have developed a sound knowledge and appreciation of some of the tools, concepts, models, and computations used in the study of networks. The study of networks is predominantly a modern subject, so the students will also be expected to develop the ability to read and understand current (2016) research papers in the field.

Synopsis:
1. Introduction and Basic Concepts (1-2 lectures): nodes, edges, adjacencies, weighted networks, unweighted networks, degree and strength, degree distribution, other types of networks.
2. Small Worlds (2 lectures): clustering coefficients, paths and geodesic paths, Watts-Strogatz networks [focus is on modelling and heuristic calculations].
4. Additional Summary Statistics and Other Useful Concepts (2 lectures): modularity and assortativity, degree-degree correlations, centrality measures, communicability, reciprocity and structural balance.
5. Random Graphs (2 lectures): Erdős-Rényi graphs, configuration model, random graphs with clustering, other models of random graphs or hypergraphs; application of generating-function methods [focus is on modelling and heuristic calculations; material in this section forms an important basis for sections 6 and 7].
7. Dynamics on (and of) Networks (3-4 lectures): general ideas, models of biological and social contagions, percolation, voter and opinion models, temporal networks, other topics.
8. Additional Topics (0-2 lectures): games on networks, exponential random graphs, network inference, other topics of special interest to students [depending on how much room there is and interest of current students].

Reading (most important are [2] and [3]):

3. Various papers and review articles (see the Math C5.4 blog at http://networksoxford.blogspot.co.uk for examples). The instructor will indicate a small number of specific review articles that are required reading, and other helpful (but optional) articles will also be indicated.

Collisionless Plasma Physics — Prof. Felix Parra-Diaz — 16HT

**Method of Assessment:** Take-home examination.

**Weight:** Unit.

**Areas:** Astro.

**Prequel:** Kinetic Theory (MT), an undergraduate course on Electricity and Magnetism.

**Sequel:** Collisional Plasma Physics (TT) (note however that this course is self-contained and can be taken without continuing to Collisional Plasma Physics).

Supersymmetry and Supergravity — Dr Joseph Conlon — 24HT

**Method of Assessment:** Invigilated written examination in TT.

**Weight:** 1.5 units.

**Areas:** PT.

**Pre-requisite:** Quantum Field Theory (MT)

**Syllabus:** Motivations for supersymmetry, spinor algebras and representations, supersymmetry algebra and representations, extended supersymmetry and BPS states, superfields, SUSY field theories, non-renormalisation theorems, SUSY breaking, the MSSM and its phenomenology, rescaling anomalies, NSVZ beta function, basic properties of supergravity.

**Method of Assessment:** Mini-project.

**Weight:** Unit.

**Areas:** Astro.

**Prequel/pre-requisite:** Kinetic Theory (MT).

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: Astro.
Prequel: an introductory course on Fluid Dynamics.

Stellar Astrophysics — Prof. Philipp Podsiadlowski — 18HT/TT

Method of Assessment: Take-home exam; homework completion requirement.
Weight: Unit.
Areas: Astro.

Syllabus Part I (Part of C1, 10 lectures in HT, of which the first two will be a primer on basic stellar astrophysics): Modern topics in stellar astrophysics. Late stages of stellar evolution; massive stars; supernovae, millisecond pulsars, hypernovae, gamma-ray bursts; compact binaries; the origin of elements, chemical evolution of the Universe.

Part II (8 lectures TT): Accretion discs: theory and applications. Accretion disc theory, thin and thick discs; disc instabilities (thermal instability, gravitational instabilities [Toomre criterion]); optically thin advection-dominated flows, super-Eddington accretion; the magnetorotational instability.

High-Energy Astrophysics — Dr Garret Cotter — 18HT/TT

Method of Assessment: Take-home exam; homework completion requirement.
Weight: Unit.
Areas: Astro.

Syllabus: Part I (Part of C1, 10 lectures in HT): Physics of interactions between high energy particles and radiation (synchrotron, inverse-Compton, thermal bremsstrahlung); the Eddington limit; accretion onto compact objects; black holes, active galaxies and relativistic jets. Part II (8 lectures TT): Acceleration of ultra relativistic particles; Cherenkov Radiation; Very-high-energy gamma rays and cosmic rays; Milky Way gamma-ray sources; GZK cutoff; Comptonization of the CMBR.
General Relativity II — Prof. Xenia de la Ossa — 16HT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT/Astro.
Prequel/Pre-requisite: General Relativity I (MT) or equivalent.

Overview: In this, the second course in General Relativity, we have two principal aims. We first aim to increase our mathematical understanding of the theory of relativity and our technical ability to solve problems in it. We apply the theory to a wider class of physical situations, including gravitational waves and black hole solutions. Orbits in the Schwarzschild solution are given a unified treatment which allows a simple account of the three classical tests of Einstein’s theory. This leads to a greater understanding of the Schwarzschild solution and an introduction to its rotating counterpart, the Kerr solution. We analyse the extensions of the Schwarzschild solution show how the theory of black holes emerges and exposes the radical consequences of Einstein’s theory for space-time structure.

Synopsis: Mathematical background, the Lie derivative and isometries. The Einstein field equations with matter; the energy-momentum tensor for a perfect fluid; equations of motion from the conservation law. Linearised general relativity and the metric of an isolated body. Motion on a weak gravitational field and gravitational waves. The Schwarzschild solution and its extensions; Eddington-Finkelstein coordinates and the Kruskal extension. Penrose diagrams and the area theorem. Stationary, axisymmetric metrics and orthogonal transitivity; the Kerr solution and its properties; interpretation as rotating black hole.

Reading

Further Reading

Cosmology — Dr Johannes Noller — 16HT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: Astro/PT.
Pre-requisite: General Relativity I (MT) or equivalent.

Syllabus: Einstein field equations and the Friedman equations, universe models, statistics of expanding background, relativistic cosmological perturbations, observations, from the Hubble flow to the CMB.
Applied Complex Variables — Prof. Peter Howell — 16HT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT/CM/Astro.
Prequel: Perturbation Methods (MT).

Overview: The course begins where core second-year complex analysis leaves off, and is devoted to extensions and applications of that material. It is assumed that students will be familiar with inviscid two-dimensional hydrodynamics (Part A Waves and Fluids) to the extent of the existence of a harmonic stream function and velocity potential in irrotational compressible flow, and Bernoulli’s equation.

Synopsis: Review of core complex analysis, especially continuation, multiforms, contour integration, conformal mapping and Fourier transforms.

Riemann mapping theorem (in statement only). Schwarz-Christoffel formula. Solution of Laplace’s equation by conformal mapping onto a canonical domain. Applications to inviscid hydrodynamics: flow past an aerofoil and other obstacles by conformal mapping; free streamline flows of hodograph plane. Unsteady flow with free boundaries in porous media.

Reading

Scientific Computing II — Prof. Nick Trefethen — 12HT

Method of Assessment: Take-home-exam in HT; homework completion requirement.
Weight: 1.5 units with Scientific Computing I (cannot be taken separately).
Areas: PT/CM/Astro.
Prequel/pre-requisite: Scientific Computing I (MT).

Differential Geometry — Prof. Dominic Joyce — 16HT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT/Astro.
Overview: A manifold is a space such that small pieces of it look like small pieces of Euclidean space. Thus a smooth surface is an example of a (2-dimensional) manifold.

Manifolds are the natural setting for parts of classical applied mathematics such as mechanics, as well as general relativity. They are also central to areas of pure mathematics such as topology and certain aspects of analysis.

In this course we introduce the tools needed to do analysis on manifolds. We prove a very general form of Stokes’ Theorem which includes as special cases the classical theorems of Gauss, Green and Stokes. We also introduce the theory of de Rham cohomology, which is central to many arguments in topology.

Learning Outcomes: The candidate will be able to manipulate with ease the basic operations on tangent vectors, differential forms and tensors both in a local coordinate description and a global coordinate-free one; have a knowledge of the basic theorems of de Rham cohomology and some simple examples of their use; know what a Riemannian manifold is and what geodesics are.

Reading

Geometric Group Theory — Dr Andre Henriques — 16HT

Method of Assessment: Invigilated written examination in TT.
Weight: Unit.
Areas: PT.

Overview: The aim of this course is to introduce the fundamental methods and problems of geometric group theory and discuss their relationship to topology and geometry.

The first part of the course begins with an introduction to presentations and the list of problems of M. Dehn. It continues with the theory of group actions on trees and the structural study of fundamental groups of graphs of groups.
The second part of the course focuses on modern geometric techniques and it provides an introduction to the theory of Gromov hyperbolic groups.

**Synopsis:** Free groups. Group presentations. Dehn’s problems. Residually finite groups.

Group actions on trees. Amalgams, HNN-extensions, graphs of groups, subgroup theorems for groups acting on trees.

Quasi-isometries. Hyperbolic groups. Solution of the word and conjugacy problem for hyperbolic groups.

If time allows: Small Cancellation Groups, Stallings Theorem, Boundaries.

**Reading.**

**Further Reading.**

**Trinity Term**

Conformal Field Theory — Prof. Fernando Alday — 16TT

**Method of Assessment:** No formal assessment; homework completion requirement.

**Weight:** Unit.

**Areas:** PT/CM.

**Prequel/pre-requisite:** Quantum Field Theory (MT)

**Syllabus:** Scale invariance and conformal invariance in critical behaviour, the role of the stress tensor, radial quantisation and the Virasoro algebra, CFT on the cylinder and torus, height models, loop models and Coulomb gas methods, boundary CFT and Schramm-Loewner evolution, perturbed conformal field theories: Zamolodchikov’s c-theorem, integrable perturbed CFTs: S-matrices and form factors.
Introduction to Gauge-String Duality — Prof. Andrei Starinets — 16TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: PT/CM.
Pre-requisite: Quantum Field Theory (MT).

Syllabus: Duality in lattice statistical mechanics and quantum filed theory (an overview), black hole thermodynamics and black hole entropy, D-branes, the AdS-CFT correspondence, main recipes of gauge-string duality, gauge-string duality at finite temperature and density, fluid mechanics, black holes and holography, transport in strongly correlated systems from dual gravity, gauge-string duality and condensed matter physics, modern developments.

Topics in Soft and Active Matter Physics — Prof. Julia Yeomans — 8TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: 0.5 unit.
Areas: CM
Pre-requisites: Soft Matter Physics (HT).

Syllabus: This is a reading course. Under the guidance of the course organiser, students will give presentations based on key papers in soft condensed matter theory. Some examples of the topics for these presentations are: Active nematics and active gels. Wetting, spreading and contact line dynamics. Hydrodynamics of microswimmers: Stokes equation, scallop theorem, multipole expansion, active suspensions. Fluctuations and response.

Complex Systems — Prof. Mason Porter — 16TT

Method of Assessment: Mini-project.
Weight: Unit.
Areas: CM/Astro
Prequel: Networks (HT)
Pre-requisite: Statistical Mechanics (MT) or another undergraduate course in statistical mechanics.

Syllabus: Percolation, fractals, self-organised criticality, and power laws. Stochastics and generative models: random walks, preferential attachment, master equations. Dynamical systems on networks: includes models of epidemics, social influence, voter models, etc. and how they are affected by network architecture. Agent-based models. Numerical methods: Monte Carlo, simulated annealing, etc.

String Theory II — Prof. Philip Candelas — 16TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: PT.
Prequel/pre-requisite: String Theory I (HT).

Syllabus: Superstring action, super-Virasoro algebra, RNS model and GSO projection, physical spectrum, type I, IIA, IIB and heterotic strings, D-branes, string dualities.
The Standard Model — Dr Juan Rojo — 16TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: PT.
Prequel/pre-requisite: Advanced Quantum Field Theory for Particle Physics (HT).

Syllabus: Part I. Weak interactions, weak decays, non-renormalizable Fermi four-point interactions (violation of unitarity), $SU(2) \times U_Y(1)$ gauge symmetry, spontaneous symmetry breaking (masses of gauge bosons), custodial symmetry and Yukawa masses, axial anomaly cancellation, accidental symmetries, renormalizability and power counting, neutrino masses (see-saw mechanism), Higgs phenomenology, Part II. Strong interaction, $SU(3)$ symmetry, Lagrangian, color identities, beta-function and asymptotic freedom, infrared divergences and infrared safety, $e^+e^- \rightarrow$ hadrons, R-ratio, parton model (failure with radiative corrections), parton distribution functions, dimensional regularisation, subtraction procedures for calculations of cross-sections, hadron collider phenomenology: event shapes, jets, benchmark processes (Drell-Yan, heavy quarks etc.).

Topics in Quantum Condensed Matter Physics — Prof. John Chalker — 8TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: 0.5 units.
Areas: CM.
Prequel/pre-requisite: Quantum Condensed Matter Physics II (HT).

Syllabus: This is a reading course. Under the guidance of the course organiser, students will give presentations based on key papers in quantum condensed matter theory. Some examples of the topics for these presentations are: Kramers-Wannier duality for the Ising model. Feynman’s wavefunction approach to superfluid helium. The Haldane conjecture for integer quantum spin chains. Quantum friction. Homotopy and defects. Renormalisation group for Fermi liquids. The Kondo effect and scaling. Fractional statistics. Hartree-Fock and random-phase approximations.

Beyond the Standard Model — Prof. John March-Russell — 16TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: PT.
Prequel/pre-requisite: Advanced Quantum Field Theory for Particle Physics (HT).

Syllabus: SM precision tests, flavour physics, neutrino physics, strong CP and axions, hierarchy problem, motivations for susy/technicolour/warped extra dimensions and their basic phenomenology, introduction to grand unified theories.

Critical Phenomena — Prof. Paul Fendley — 16TT

Method of Assessment: Take-home exam; homework completion requirement.
Weight: Unit.
Areas: CM.
Pre-requisites: Quantum Field Theory (MT), Statistical Mechanics (MT) or equivalent.

Syllabus: Phase transitions in simple systems. Mean field theory and its limitations (Landau theory). Basic

Collisonal Plasma Physics — Prof. Felix Parra-Diaz — 16TT

Method of Assessment: Take-home exam.
Weight: Unit.
Areas: Astro.
Prequel: Kinetic Theory (MT), Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT).

Syllabus: Collision operators (5 lectures): Fokker-Plank collision operator, conservation properties, entropy, electron-ion and ion-electron collisions, linearized collision operator.

Collisional transport (Braginskii equations) (5 lectures): derivation of Spitzer resistivity and electron heat conduction, ion heat conduction and viscosity.

Resistive MHD (3 lectures): tearing modes, magnetic reconnection.

Introduction to tokamak theory (3 lectures): large-aspect-ratio MHD equilibrium, particle trapping, Pfirsch-Schlueuter collision transport regime for electrons.

Non-perturbative Methods in Quantum Field Theory — Prof. Mike Teper — 16TT

Method of Assessment: T.B.C.
Weight: Unit.
Areas: PT.
Prequel/pre-requisite: Advanced Quantum Field Theory for Particle Physics (HT).

Syllabus Solitons. Kinks in D=1+1 scalar (Quantum) Field Theory. A no-go theorem and its limitations: vortices in D=2+1 scalar FT (KT phase transition). Vortices in D=2+1 gauge+scalar FT; solitonic 'strings' in D=3+1 gauge+scalar FT (Meissner effect and dual-superconductor confinement); textures; domain walls; homotopy groups. Monopoles in the D=3+1 Georgi-Glashow model.

Instantons. Tunnelling in D=1+1 Quantum Mechanics. Abelian-Higgs model in D=1+1 FT: the dilute gas approximation, n-vacua and theta-vacua; Wilson loops and linear confinement. SU(2) gauge fields in D=3+1: the dilute gas calculation, n-vacua (Chern-Simons) and theta-vacua, SU(N) and intertwined theta-vacua. Fermions and index theorems; anomalies and chiral symmetry breaking (Banks-Casher), charge fractionalisation, sphalerons and the baryon asymmetry in the Standard Model.

Lattice Field Theory: Motivation and applications; gauge fields on a lattice and continuum limit(s); strong coupling calculations; fermions on a lattice; Markovian Monte Carlo: Metropolis, heat bath. Some applications drawn from: lightest glueball masses; the running coupling; large N; non-zero temperature; (near-)conformal field theories.

Astroparticle Physics — Prof. Subir Sarkar — 16TT

Method of Assessment: No formal assessment; homework completion requirement.
Weight: Unit.
Areas: PT/Astro.
Pre-requisites: Quantum Field Theory (MT), General Relativity I (MT).
**Syllabus:** The Universe observed, constructing world models, reconstructing our thermal history, decoupling of the cosmic microwave background, primordial nucleosynthesis. Dark matter: astrophysical phenomenology, relic particles, direct and indirect detection. Cosmic particle accelerators, cosmic ray propagation in the Galaxy. The energy frontier: ultrahigh energy cosmic rays and neutrinos. The early Universe: constraints on new physics, baryo/leptogenesis, inflation, the formation of large-scale structure, dark energy.

**Quantum Field Theory in Curved Space-Time — Dr Christopher Eling — 16TT**

**Method of Assessment:** No formal assessment; homework completion requirement.

**Weight:** Unit.

**Areas:** PT/Astro.

**Prequels/pre-requisites:** Quantum Field Theory (MT), General Relativity I (MT).

### C Case Studies

The following table details some examples of possible pathways through the Programme. These case studies are for illustrative purposes only and show the breadth and diversity of the programme. Many other paths through the course are possible — and in fact much more eclectic or more generalist selections of courses may be appropriate for students who have not settled on a specialisation they intend to pursue eventually. Indispensable courses (“core”) for each given case study are indicated in bold. 1 unit=16 lectures; at least 10 units have to be taken over three terms. Note that some of the Case Studies below are sufficiently broad to allow multiple pathways within them, however you should ensure that your chosen pathway allows you to fulfil the requirements for the overall number of units and the number of assessed units. Please see the examination conventions for further details of these requirements.

### D Suggested Dissertation Topics

**Axions and the Strong CP Problem**

**Supervisor:** Joseph Conlon ([joseph.conlon@physics.ox.ac.uk](mailto:joseph.conlon@physics.ox.ac.uk))

**Abstract:** Axions arose originally as a solution to the strong CP problem of the Standard Model. This dissertation will review the strong CP problem and explain why axions lead to a solution of it. It will review the basic physics of axions and can then branch off into a number of directions. Depending on the interests of the student(s), it may involve how axions arise in string theory and string compactifications, the phenomenological bounds on axions and how searches for axions are carried out, the extension from the QCD axion to more general axion-like particles and the associated physics of these, or the cosmology of axions and their possible role as dark matter.

**References:** Chapter 5 and 14 of Raffelt (Stars as Laboratories for Fundamental Physics), and Chapter 10 of Kolb+Turner (The Early Universe) for starting points. Students wishing to do this dissertation are also advised to arrange a meeting with Prof. Conlon who will provide more guidance as to further reading.
Higgs Pair Production at the LHC
Supervisor: Juan Rojo (juan.rojo@physics.ox.ac.uk)

Abstract: The measurement of Higgs pair production is one of the cornerstones of the LHC program for the next years. Double Higgs production provides a unique window to the electroweak symmetry breaking mechanism, and in particular it allows to access the Higgs trilinear coupling. It is however a extremely challenging measurement, due to the small production rates and the large SM backgrounds. The aim of this Dissertation is to review the status of feasibility studies of Higgs pair production at the LHC in different final states, both using traditional cut-based techniques and based on modern multivariate analysis methods.

References:

Topological Defects in Liquid Crystals
Supervisor: Julia Yeomans (Julia.Yeomans@physics.ox.ac.uk)

Abstract: Liquid crystals are characterised by long thin molecules, which can order into many different phases. Singularities, or topological defects correspond to singular points in the order parameter field and can now be controlled by eg optical tweezers to create designed structures with photonic applications. This essay could concentrate on the more mathematical aspects of describing topological defects in liquid crystals or on novel defect phases and recent applications.

References:

Spatial Networks
Supervisor: Mason Porter (mason.porter@maths.ox.ac.uk)

Abstract: Over the last two decades, the quantitative study of networks has emerged as a fundamental tool for the study of complex systems, in part for its ability to provide a rigorous foundation for the study of physical, biological, and social complexity. Networks are represented mathematically as graphs and their generalizations. In the simplest situation, the nodes of a graph represent some sort of entity, and the edges of a graph represent pairwise connections between entities. A key but underexplored feature of networks is the effect of space on network structure and dynamical systems on networks. The purpose of this project is to examine examples of such spatial networks and to elucidate, using specific examples, some effects of being embedded in spaces of different dimensions and/or types of spaces. Possible topics include transportation networks, granular force networks, and others.

References:
Notes:
1. Other journal papers to be determined according to specific research topic.
2. Projects on topics other than spatial networks within the general field of ‘network science’ are also possible. Specific choice of topics is in consultation with me.

Superfluidity in helium-3
Supervisor: John Chalker (John.Chalker@physics.ox.ac.uk)
Abstract: In fermion systems, superconductivity or superfluidity arises from pairing of fermions followed by condensation. The simplest possibility is for the pairs to have zero relative angular momentum (‘s-wave pairs’), and all of the early experimental examples were of this type. Helium-3 is interesting as the first case discovered of spin-one, p-wave pairs.
References:

The fractional quantum Hall effect
Abstract: The discovery of the fractional quantum Hall effect started a new era in physics, with ramifications that are still under exploration. Its remarkable features include quasiparticles with fractional charge and with quantum statistics that are not those of either fermions or bosons.
Supervisor: John Chalker (John.Chalker@physics.ox.ac.uk)
References:

Equations of state in a strong magnetic field
Adviser: Peter A Norreys (Peter.Norreys@physics.ox.ac.uk)
Abstract: The equations of state for matter on the surface of pulsars, neutron stars and white dwarfs are strongly influenced by the magnetic field strength there. The appropriate domain for electron degeneracy and for Landau quantization has been calculated for the density-temperature domain relevant to these extreme conditions in the literature. The student will explore the conditions for a strong Landau quantization, for magnetic fields in the domain of up to 10 MT and beyond. The student will also formulate the equations of state in terms of those that can potentially be realized in laboratory plasmas using next generation laser facilities.

Algebro-Geometric Approaches for Integrable Systems
Adviser: Robert A Van Gorder (Robert.VanGorder@maths.ox.ac.uk)
Abstract: Algebro-Geometric tools [1] have been employed to obtain solutions to a variety of integrable systems; see [2,3,4,5]. In this project, the student would review some of these methods, and attempt to
apply them to an integrable system. One logical application would be to 3x3 systems such as that arising in the nonlinear three-wave interaction [6] or its generalizations [7], as this would effectively extend the work in [2]. This would be a nice project for a pure mathematics student looking to broaden their horizons and apply what they know to integrable systems theory.

Prerequisites: Algebraic Geometry (as a co-requisite). Knowledge of partial differential equations (from either an analysis or application point of view) will be useful for intuition.

References:

Nonlinear Waves

Adviser: Robert A Van Gorder (Robert.VanGorder@maths.ox.ac.uk)

Abstract: Nonlinear waves appear as solutions to nonlinear PDE models used throughout science and engineering, and it would be easy to find particular applications relevant to the interested student. Possible directions could be nonlinear waves in discrete dynamics (with applications including, e.g., granular media [1], optics or atomic physics [2]), continuous dynamics (e.g., nonlinear waves along vortex filaments [3], Bose-Einstein condensates [4]), or even network dynamics [5]. Particular specifications of the application and model studied, as well as the degree to which the project is theory or application driven, can be made based upon student interests.

Prerequisites: Some experience with solving PDEs: asymptotic, perturbation, numerical approaches.

Relativistic Superfluidity and Vorticity
Adviser: Robert A Van Gorder (Robert.VanGorder@maths.ox.ac.uk)

Quantized vortex filament dynamics (including reconnection events) in superfluids are often studied under the local induction approximation (LIA) [1], which can be put into correspondence with cubic NLS (see [2] for classical case, [3] for the quantum case). In the relativistic regime, superfluidity and vorticity can be studied under the framework of a nonlinear Klein-Gordon model in curved spacetime whose phase dynamics give rise to superfluidity [4]. The interested student will explore this latter situation.

Prerequisites: Some experience with PDEs: asymptotic, perturbation, numerical approaches.

References:

Fluctuation and Relaxation in Stellar Systems
Adviser: James Binney (james.binney@physics.ox.ac.uk)

Abstract: Fluctuations in the gravitational field around its mean-field value drive the evolution of globular clusters. Traditionally the fluctuations are considered to arise from many 2-body encounters. Explain why Poisson fluctuations in density provide a better starting point. Using this model obtain a order-of-magnitude estimate of the relaxation time of a spherical cluster. If time permits sketch computation of diffusive flux through action space for case of isochrone model.

Relevant courses: Kinetic Theory (MT), Galactic and Planetary Dynamics (HT).

References:

Dynamics of extrasolar planets
Adviser: Caroline Terquem (caroline.terquem@physics.ox.ac.uk)

Abstract: A significant number of the extrasolar planets detected so far have orbital characteristics very different from those of the planets in our Solar system. The dissertation could focus on some particular
characteristic (orbital eccentricity, or orbital period, or inclination of the orbital plane with respect to the
stellar equatorial plane, etc.), and summarise the observations and the theories/models which have been put
forward to try to account for these observational facts.

of Astronomy and Astrophysics, 2015

Instabilities in collisionless astrophysical plasmas
Adviser: Alexander Schekochihin (alex.schekochihin@physics.ox.ac.uk)

Abstract: Any local flows of matter or energy in collisionless (or weakly collisional) plasmas cause these
plasmas to develop local pressure anisotropies, which provide a source of free energy to very vigorous
instabilities. In unmagnetised plasmas, these are known under the general moniker of Weibel instabilities
and are believed to be responsible for magnetogenesis in collisionless shocks and shear flows. In magnetised
plasmas, the pressure anisotropies develop with respect to the local direction of the magnetic field. The result
is that magnetic tension force or magnetic pressure can effectively become negative in such plasmas, giving
rise to the firehose and mirror instabilities. The role of these instabilities in the dynamics of astrophysical
plasmas (in environments such as intergalactic medium, accretion discs, supernova shocks) has been the
subject of much recent interest and research, much of it due to heavy-duty kinetic simulations becoming
possible on modern computers. This dissertation will examine how pressure anisotropies arise and how to
construct the linear theory of the relevant instabilities. If time and energy are left after that, nonlinear
theory of the firehose and mirror can also be studied. There will be considerable opportunity for the
student to choose their own path through the relevant topics and the literature. While most of the material
can be learned from existing literature (both classic and recent), there is potential for some research-level
calculations.

Relevant Courses: Kinetic Theory (MT), collisionless Plasma Physics (HT).

References:

2. A selection of research articles.

Hydrodynamic and MHD turbulence
Adviser: Alexander Schekochihin (alex.schekochihin@physics.ox.ac.uk)

Abstract: Kolmogorov’s 1941 scaling theory of developed turbulence. Structure of statistical correlations
of an isotropic vector field (fluid velocity). von Karman-Howarth equations and the exact scaling law for
3rd-order moments (the 4/5 law). Theory of intermittency: Kolmogorov and She-Leveque.

If students time and energy permit, this dissertation can also cover the theory of MHD turbulence (or,
alternatively, the student can skip some of the hydro topics and skip to MHD):

Scaling theories: Goldreich-Sridhar theory, critical balance, dynamic alignment. Weak turbulence theory for
Alfven waves. Intermittency models and further refinements. (These latter topics contain some potential
for research-relevant contributions.)

Other optional topics that can be covered in addition or instead of MHD: Application of the critical balance
principle to rotating and stratified turbulence. Kolmogorov-style theory for turbulence in kinetic (collision-
less) plasma.
Relevant Courses: a course in fluid dynamics; MHD part of Advanced Fluid Dynamics (HT) or equivalent if the student wishes to cover MHD turbulence.

References:

1. Lecture notes: http://www-thphys.physics.ox.ac.uk/people/AlexanderSchekochihin/notes/SummerSchool07/
5. A selection of research articles on MHD turbulence and other topics.

Solvable models for passive turbulent fields
Adviser: Alexander Schekochihin (alex.schekochihin@physics.ox.ac.uk)

Abstract: Normally it is (or has so far been) impossible to obtain analytic solutions for correlation functions in turbulent systems. However, for a class of models, analytical treatment is possible: those concern the turbulent advection of scalar and vector fields in an imposed random flow most often white-in-time Gaussian random velocity field is used, as a far-fetched but solvable model of turbulent flow. Exact analytical results can be obtained for this model and it is remarkable how well they tend to work. The two main applications are the advection of a scalar, describing turbulent mixing of a temperature field in a fluid (or perhaps of the concentration of an admixture), and the advection of a vector, describing the evolution of a weak magnetic field in a turbulent conducting fluid. The latter is a model for the so-called turbulent dynamo amplification of mean magnetic energy via random stretching and tangling by a turbulent flow, believed to be responsible for the origin of cosmic magnetism (dynamically strong tangled magnetic fields observed in the interstellar and intergalactic medium, on the surface of the Sun and in many other places). This dissertation will help the student learn both the physics of passive advection and a suite of analytical techniques for handling stochastic systems. While most of the material is standard, there is some potential for research-level calculations, which can be attempted if the student so desires.

Relevant Courses: Nonequilibrium Statistical Physics (MT), a course in fluid dynamics, MHD part of Advanced Fluid Dynamics (HT) or equivalent.

References:

1. Lecture notes: ask supervisor.
4. A selection of research articles.

Stellarator physics
Adviser: Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)

Abstract: Stellarators are one of the most clever ideas proposed for magnetic confinement fusion energy, but it has taken decades to get them to be competitive when compared with their main competitor, the tokamak. The reasons for this delay are fundamentally theoretical: 1) it is not clear whether our current description of the stellarator magnetic fields is appropriate, and 2) it is possible to prove that a stellarator that perfectly confines charged particles does not exist, although it is also possible to show that one can get as close to perfect confinement as desired. The student will study these subtleties, and will learn how
the stellarator theory community has built on this knowledge to construct one of the most exciting current experiments: Wendelstein 7X in Germany, which started operations this year.

Relevant Courses: Kinetic Theory (MT), Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT).

References:

Gyrokinetics
Adviser: Michael Barnes (michael.barnes@physics.ox.ac.uk) or Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)

Abstract: Gyrokinetics is a powerful technique to describe plasma fluctuations with characteristic frequencies below the Larmor frequency. The power of the technique resides in its choice of phase space coordinates. The student will learn how to derive gyrokinetics, and will study one or two of its applications to fusion or astrophysics.

Relevant Courses: Kinetic Theory (MT), Collisionless Plasma Physics (HT).

References:

MHD equilibrium and stability in axisymmetric magnetic fields
Adviser: Michael Barnes (michael.barnes@physics.ox.ac.uk) or Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)

Abstract: Magnetic confinement fusion requires magnetic field topologies in which the magnetic field lines never get in contact with the solid boundary. This requirement leads to toroidal configurations that must satisfy the MHD equilibrium equations. The most successful of all the possible configurations is the axisymmetric tokamak. The student will study the equilibrium and stability of tokamak plasmas, learning about the most dangerous types of instabilities that limit current experiments and future fusion reactors.

Relevant Courses: Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT).

References:

**Non-equilibrium Statistical Physics with Action-Reaction Asymmetry**

Adviser: Ramin Golestanian (ramin.golestanian@physics.ox.ac.uk)

Abstract: The third law of Newton is a fundamental pillar of mechanics on which equilibrium statistical mechanics is built. There are many examples in non-equilibrium physics where this is violated, i.e. the velocity of particle A as a result of its interaction with particle B is not the opposite (negative) of the velocity of particle B as a result of its interaction with particle A. We would like to formulate the non-equilibrium statistical physics of a collection of such particles using a many-body Smoluchowski (or Fokker-Plank) description, and study it using various approximation techniques.

References:

**Motility-induced Phase Separation of Spinners**

Adviser: Ramin Golestanian (ramin.golestanian@physics.ox.ac.uk)

Abstract: In a collection (or suspension) of active particles, the presence of translational motility works together with excluded volume interactions to create dense clusters that separate from more dilute regions; a phenomenon that has been called motility-induced phase separation. A key requirement of this phase separation is the presence of translational self-propulsion. Recently, it has been shown that spinning will also lead to a similar effect, but the mechanisms of this transition is currently not known. We would like to formulate this problem using the standard continuum methodology of active matter, by deriving the relevant form of the theory from a microscopic description.

References:

**Sloppy Systems**

Adviser: Ard Louis (ard.louis@physics.ox.ac.uk)

Abstract: Many models in biology, engineering and physics have a very large number of parameters. Often many of these are only known approximately. Moreover, in John von Neuman’s famous quip “with four parameters I can fit an elephant, and with five I can make him wiggle his trunk.” suggests that only a small set of these parameters are actually relevant? Could there be a fundamental theory of these complex systems that allows us to work out what the key parameters are?

References:

**Survival of the Flattest or Arrival of the Frequent?**

Adviser: Ard Louis (ard.louis@physics.ox.ac.uk)

Abstract: Evolution proceeds by mutations to genotypes that in turn change phenotypes (the organism). But since the number of genotypes is much larger than the number of phenotypes, concepts of genetic entropy must enter into the equations, which means methods from statistical mechanics become relevant. In some cases, the entropy means that the phenotypes that end up surviving are not the fittest. Two different scenarios are the “survival of the flattest” and the “arrival of the fittest”. Sometimes these are confused, so a clear explanation of how they are similar, and where they differ is needed.

References:

**Black hole entropy in string theory and holography**

Adviser: Andrei Starinets (andrei.starinets@physics.ox.ac.uk)

Abstract: Bekenstein and Hawking have shown that black holes can be assigned an entropy whose existence effectively converts the laws of black hole mechanics into the laws of black hole thermodynamics. String theory offers a number of convincing examples explaining the microscopic origin of black hole entropy. The concept can be generalized further to include higher-derivative terms in gravity and is used extensively in modern applications of holography and string theory. The dissertation will review these and related developments in some detail, depending on the interests of the student(s).

References:

56
Hawking radiation of black holes

Adviser: Andrei Starinets (andrei.starinets@physics.ox.ac.uk)

Abstract: Inspired by work of Zeldovich and Starobinsky, Hawking showed in his classic 1974 paper that black holes emit blackbody radiation at a temperature proportional to the surface gravity at the horizon. The dissertation will review the existing approaches to deriving the Hawking’s result including his original calculation as well as more recent method of Parikh and Wilczek and explore applications of these results and further developments, depending on the interests of the student(s).

References:

Quasinormal modes of black holes and black branes

Adviser: Andrei Starinets (andrei.starinets@physics.ox.ac.uk)

Abstract: Eigenmodes of black holes are called quasinormal modes due to the presence of a non-zero imaginary part in the spectrum associated with the existence of the horizon. Quasinormal spectra describe near-equilibrium properties of black holes. More recently, in the context of gauge-string duality, they were shown to coincide with poles of the retarded two-point functions in a dual quantum field theory. The dissertation will review the developments in this field including formal aspects of non-Hermitian boundary value problem or applications, depending on the interests of the student(s).

References:

Supersymmetric quantum mechanics

Adviser: James Sparks (James.Sparks@maths.ox.ac.uk)

Abstract: Supersymmetric quantum mechanics is often introduced as a toy model for supersymmetric quantum field theory. However, it also has some surprisingly powerful applications to differential geometry. The aim of this dissertation would be to present an account of supersymmetric quantum mechanics, via both canonical quantization and the path integral, and discuss the Witten index. The supersymmetric quantum mechanics based on a sigma model with target space a Riemannian manifold has Witten index equal to the...
Euler characteristic of the manifold. One can use this structure to give novel physics proofs of two famous mathematical results: the Morse inequalities, and the Gauss-Bonnet formula.

E  Suggested Oral Presentation Topics

**The Path Integral in Quantum Field Theory**
Adviser: Joseph Conlon (joseph.conlon@physics.ox.ac.uk)

Abstract: The talk will describe Feynman’s path integral approach to quantum field theory. The talk should review the action principle and explain the basics of where the path integral comes from and how it is used in calculations. The talk will hopefully also contain a more advanced application, such as to non-perturbative effects in quantum field theory or to the calculation of anomalies.

References: Any good textbook on quantum field theory contains accounts of path integrals

**The Structure of the Proton and LHC Phenomenology**
Adviser: Juan Rojo (juan.rojo@physics.ox.ac.uk)

Abstract: The accurate determination of the Parton Distribution Functions (PDFs) of the proton is an essential ingredient of the LHC program. PDF uncertainties impact a wide range of processes, from Higgs boson characterisation and precision Standard Model measurements to New Physics searches. A major recent development in modern PDF analyses has been to exploit the wealth of new information contained in precision measurements from the LHC Run I, as well as progress in tools and methods to include these data in PDF fits. The aim of this project is to study the information that PDF-sensitive measurements at the LHC have provided so far, and to review the implications of next-generation PDF determinations for LHC phenomenology.

References:

**Swimming at Low Reynolds Number**
Adviser: Julia Yeomans (Julia.Yeomans@physics.ox.ac.uk)

Abstract: Because of their size bacteria and fabricated micro-swimmers swim at low Reynolds number, a regime where the effect of hydrodynamics can be counterintuitive. The talk could include explanations of the Scallop theorem, dipolar flow fields or active swimming in Poiseuille flow.

References:
Temporal Networks
Adviser: Mason Porter (mason.porter@maths.ox.ac.uk)

Abstract: Over the last two decades, the quantitative study of networks has emerged as a fundamental tool for the study of complex systems, in part for its ability to provide a rigorous foundation for the study of physical, biological, and social complexity. Networks are represented mathematically as graphs and their generalizations. In the simplest situation, the nodes of a graph represent some sort of entity, and the edges of a graph represent pairwise connections between entities. Networks that change in time are called "temporal networks", and such time-dependence can have a large effect on both network structure and dynamical processes on networks. This oral presentation will give an introduction to temporal networks and also explore a specific topic within it.

Contagions on Networks
Adviser: Mason Porter (mason.porter@maths.ox.ac.uk)

Abstract: Over the last two decades, the quantitative study of networks has emerged as a fundamental tool for the study of complex systems, in part for its ability to provide a rigorous foundation for the study of physical, biological, and social complexity. Networks are represented mathematically as graphs and their generalizations. In the simplest situation, the nodes of a graph represent some sort of entity, and the edges of a graph represent pairwise connections between entities. One of the most important areas of network science is the study of (both biological and social) contagions on networks. This oral presentation will give an introduction to contagions networks and also explore a specific topic within it.

References:
4. Appropriate research articles: e.g., see those cited by (2,3) and also papers that cite (2,3).

One-parameter scaling theory of Anderson localization
Adviser: John Chalker (John.Chalker@physics.ox.ac.uk)

Abstract: Anderson localisation concerns the nature of eigenstates of a particle moving in a random potential: states may either extend through the whole system or be trapped in a local region. The phase transition between these two situations can be described using quite a simple application of scaling and renormalisation group ideas.

References:

**Poor man’s scaling theory of the Kondo effect**

Abstract: The Kondo effect is an iconic problem in many-body physics of enduring importance. Poor man’s scaling theory provides a simple and appealing way to think about it.

Adviser: John Chalker (John.Chalker@physics.ox.ac.uk)

References:

**Photon bubble instability**

Adviser: Peter A Norreys (Peter.Norreys@physics.ox.ac.uk)

Abstract: Radiation dominated plasmas with very strong magnetic fields are found in a number of interesting astrophysical objects. These include blue giant stars as well as accretion powered X-ray sources, such as pulsars and active galactic nuclei. In pulsars, plasma from a binary object are accreted and follow intense magnetic field lines to the poles of the neutron star. The in-flow of matter at the poles is balanced by the radiation pressure where a shock wave is formed. Photon bubbles are formed as a result of density perturbations. A greater flux of radiation is able to pass through the low density regions and results in an imbalance in the radiation pressure. This in turn increases the flow of matter out of the low density regions, along the magnetic field lines. These photon bubbles eventually ”pop”, resulting in periodic emission of X-rays. The question is: can an experiment be designed in the laboratory to test aspects this concept?

**Instabilities in collisionless astrophysical plasmas**

Adviser: Alexander Schekochihin (alex.schekochihin@physics.ox.ac.uk)
Abstract: This presentation can cover a reduced version of the material proposed for the eponymous Dissertation: for example, explain the emergence and structure of just one of the pressure-anisotropy-driven instabilities.

Relevant courses: Kinetic Theory (MT), Collisionless Plasma Physics (HT), Dissertation on “Instabilities in collisionless astrophysical plasmas”.

Hydrodynamic and MHD turbulence
Adviser: Alexander Schekochihin (alex.schekochihin@physics.ox.ac.uk)
Abstract: This presentation can cover a reduced version of the material proposed for the eponymous Dissertation: for example, explain just the Kolmogorov scaling theory and its application to a wave-carrying system (MHD or rotating turbulence.)

Relevant courses: MHD part of Advanced Fluid Dynamics (HT) or equivalent. Dissertation on Hydrodynamic and MHD turbulence

Toroidal MHD equilibria for fusion energy
Adviser: Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)
Abstract: Magnetic confinement fusion requires magnetic field topologies in which the magnetic field lines never get in contact with the solid boundary. This requirement leads to toroidal configurations that must satisfy the MHD equilibrium equations. The student will explain how these equilibria (tokamaks and stellarators) are achieved.

Relevant courses: Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT).

Whats the right shape for a fusion machine?
Adviser: Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)
Abstract: The tokamak and the stellarator are the two magnetic fusion concepts with the best performance. These two types of devices have very different shapes, and consequently very different advantages and problems. The student will explain the differences between the two ideas, considering aspects such as stability, transport and current drive.

Relevant courses: Kinetic Theory (MT), Advanced Fluid Dynamics (HT), Collisionless Plasma Physics (HT), Collisional Plasma Physics (TT).

Adiabatic invariants of charged particle motion
Adviser: Felix Parra Diaz (felix.parradiaz@physics.ox.ac.uk)
Abstract: Adiabatic invariants are extremely useful to describe the evolution of quasiperiodic orbits. In plasma physics, there are three adiabatic invariants that have proven very useful to understand the evolution of kinetic systems such as fusion devices, the solar wind and the Van Allen belts. The student will explain what adiabatic invariants are, and will choose one application showing how to use them.
Relevant courses: Kinetic Theory (MT), Collisionless Plasma Physics (HT).

Origin and Properties of the Van Allen Radiation Belts and Ring Currents
Adviser: Michael Barnes (michael.barnes@physics.ox.ac.uk)

Abstract: The Van Allen radiation belts consist of energetic charged particles trapped in the Earth's magnetic field. These particles slowly precess around the Earth, leading to a ring current. The aim of this presentation is to explain how the charged particles are trapped in the Earth's magnetic field and what causes the precession. The student should calculate the bounce period of the charged particles as well of the precession period.

Relevant courses: Kinetic Theory (MT), Collisionless Plasma Physics (HT).

Parker Model of Solar Wind and Impact on Solar Evolution
Adviser: Michael Barnes (michael.barnes@physics.ox.ac.uk)

Abstract: The solar wind is a stream of plasma continuously flowing out from the sun. This plasma carries solar mass and angular momentum with it, potentially affecting solar evolution. The student should use fluid equations to derive a simple model (the Parker Model) for the solar wind structure and to determine the effect of the solar wind interaction with the interplanetary magnetic field. From these results one can estimate the rate of loss of solar mass and angular momentum due to the solar wind and answer the question of how the solar wind influences solar evolution.

Stochastic Dynamics with Hydrodynamic Interactions
Adviser: Ramin Golestanian (ramin.golestanian@physics.ox.ac.uk)

Abstract: Brownian particles in solution interact with each other hydrodynamically. We aim to formulate this interaction within both the Langevin and the Fokker-Planck stochastic descriptions, and show how they affect the dynamics in and out of equilibrium.
